Publication Stage :
  (B1) U.S. Patent (no pre-grant pub.) after Jan. 2, 2001
Abstract :
  A video game system is described which includes a wireless game
  controller which stores information about the user of the controller.
  The controller includes a memory for storing the information. The
  information is communicated through wireless transmissions to a
  processor which can operate a video game. The personalized information
  can include, for example, the user's name, skill level, preferred
  characters, handicaps, limitations, and/or historical game scores. The
  game controllers can include a wireless receiver for receiving
  communications from the processor to update information stored in the
  controller. Several different communication operations and protocols are
  described, including storing a user identification code in the
  controller with corresponding detailed information stored in the
  processor, or storing detailed information in the hand held controller
  and down loading the information to the processor.
